

Daniel Duany

Software Engineer | Active Top Secret Clearance | SCI Eligible

dduany919@gmail.com • (516) 279-7237 • linkedin.com/in/danielduany • github.com/Duanysblist

SUMMARY

Software Engineer with **2.5+ years** developing mission-critical systems on classified networks. Core strengths in **Java 17**, **Linux/Unix**, **RESTful services**, **Docker**, and **XML-based security policy systems**. Built and deployed containerized validation filters for cross-domain orchestration engines. Experienced in microservices architecture, DevSecOps pipelines, and Agile delivery for government customers. AWS Certified.

TECHNICAL SKILLS

Languages: Java 17, Python, C++, JavaScript, Bash, XML/XSD, Kotlin

Backend & Services: Spring Boot, RESTful APIs, Microservices, JAXB, Node.js, OOD

Frontend: Angular, React, Swing (MVC), HTML5/CSS3

DevOps & Cloud: AWS (EC2, S3, RDS, IAM, VPC), Docker, Buildah, Kubernetes, Jenkins, Maven, Git

Databases: PostgreSQL, MySQL, MongoDB, Elasticsearch

Practices: Agile/Scrum, JUnit, CI/CD, Linux/Unix, Jira, Confluence

EXPERIENCE

Software Engineer I | Arcfield | Rome, NY | Aug 2023 – Present

- **Led full OEM upgrade** impacting 500+ users on classified infrastructure — reduced security vulnerabilities by 85% and improved application performance by 30% using Linux and Docker container technologies.
- Built a **Java 17 filename validation/sanitization filter** for a cross-domain orchestration engine, enforcing character whitelists, pattern rules, and file extension validation through configurable XML security policies (JAXB) with dual reject/sanitize operating modes.
- Designed the filter's **MVC architecture** — Swing GUI for policy management (refactored from 95+ checkboxes to 4 streamlined categories), PolicyBridge for JAXB-to-GUI data conversion, and PolicySplitter to auto-generate per-file-type XML deployment artifacts.
- Containerized applications from scratch using **Buildah** with custom entypoints. Maintained **DevSecOps pipelines** (Jenkins, Maven, Git) and wrote comprehensive JUnit test suites covering validation logic, Unicode edge cases, and cross-platform path handling.
- Developed full-stack web-based applications and RESTful services on Red Hat Enterprise Linux, supporting end-user access to large data stores within the cross-domain solution architecture.
- Contributed to a 12-person Agile Scrum team delivering features on 3-week sprints. Organized and led requirements meetings with government project managers for GOTS application conversion.

PROJECTS

Cloud-Native Microservices Platform [In Progress]

- Event-driven microservices with RESTful APIs, Docker containerization, Kubernetes orchestration, and CI/CD via GitHub Actions. Demonstrates distributed systems design and DevSecOps practices.

Bionic Apocalypse — 2D RPG Game (C++)

- 4,800+ lines of C++ (SDL2) in a 4-student agile team. Built custom AABB collision detection with grid-based spatial mapping, a 12-move turn-based combat system with status effects and crafting-based weapon progression, and a 48-room map navigation engine. Cross-platform CMake builds.

ParkingPal Mobile Application

- Led Agile delivery for an 8-person team: facilitated 20+ Scrum meetings, planned sprints, delegated tasks, and managed the full SDLC from requirements through deployment of an Android sensor-based application.

CERTIFICATIONS & EDUCATION

AWS Certified Cloud Practitioner | Amazon Web Services | March 2026

B.S. Computer Science | William & Mary, Williamsburg, VA | May 2022
